This new volume in the series Physics and Chemistry of Materials with Layered Structures satisfies the need for a comprehensive review of the progress made in the decade 1972-1982 in the field of the electronic properties of layer compounds. Some recent theoretical and experimental developments are highlighted by authoritative physicists active in current research. The previous books of this series covering similar topics are volumes 3 and 4. The present review is mainly intended to fulfill the gap up to 1982 and part of 1983. I am indebted to all the authors for their friendly co-operation and continuous effort in preparing the contributions in their own fields of competence. I am sure that both the expertise scientists and the beginners in the field of the electronic properties of layered materials will find this book a valuable tool for their research work. Warm thanks are due to Prof. E. Mooser, General Editor of the series, for his constant and authoritative advice. * * * This book has been conceived as a tribute to Prof. Franco Bassani to whom the Italian tradition in the field of layer compounds, as well as in other fields of solid state physics, owes much. The authors of this review have all benefited at some time of their professional life from close cooperation with him. A Structural and Vibrational Investigation into Chromyl Azide, Acetate, Perchlorate and Thiocyanate Compounds reviews the structural and vibrational properties of chromyl azide, acetate, perchlorate, and thiocyanate from a theoretical point of view by using Density Functional Theory (DFT) methods. These compounds are extensively used in organic syntheses and the study of their structure and spectroscopy has become fundamental. This book evaluates the best theoretical level and basis set to reproduce the experimental data existing for those compounds. To this end, the optimized geometries and wavenumbers for the normal modes of vibration are calculated and the obtained results are compared and analyzed. Also, the nature of the different types of bonds and their corresponding topological properties of electronic charge density are systematically and quantitatively investigated by using the NBO analysis and the atoms in molecules theory (AIM).

Technological advancements in the present time involves innovation at all stages of research, development, diffusion and use; and in this process of continuous advancement demands all round skilling of the students as well as improvements in the employability of the pass out students. The curriculum plays an important role in the process of skilling of the students. Keeping all these under considerations, the curriculum of most of the states in the North - eastern states of India either has been revised or are in the progress. The availability of a suitable book becomes a big problem for the students and teachers as per the new/ revised curriculum/ syllabus; and to help in the teaching - learning process this book has been written. This book contains only twelve units; and each unit has been further divided into sub units. It is hoped that the text matters given in this book will attract students and teachers, and will enable the students to develop a greater interest in the science & technology, especially in the field of engineering chemistry. Any suggestion aimed to improve the content of the book will be highly appreciated. I owe my gratefulness to all those who have supported me in writing this book. I extend my thanks to the entire team of publisher for their dedication and efficient support in publishing this hand book. Dr. Rajendra Prasad, Mizoram Polytechnic, Lunglei.

Authored by one of the world's leading experts in the chemistry of lighter noble gases, this comprehensive monograph fills the need for an up-to-date review of the diverse experimental techniques and theoretical methods currently in practice. After reviewing the experiments breaking the paradigm of "non-reactive" noble gases, the physico-chemical background is introduced. Besides the emphasis on gas phase reactions, the author presents other relevant systems, such as chemistry in the bulk phase, under high pressure, and cold matrices. The discussion of gas-phase chemistry of the noble gases covers neutral and ionic compounds, diatomic molecules, complexes with small molecules and metal compounds, up to large clusters.
