The textbook for this course is Introduction to Vector Analysis by H. Davis and A. Snider (7th Edition). Supplementary materials include div grad curl and all that by H. M. Schey (recommended). The lectures will cover the following material (please, see the table of contents below for a detailed description of all sections): The introductory text covers vector algebra; single variables; scalar and vector fields; line, surface, and volume integrals; and advanced topics. This seventh edition incorporates early introduction of curvilinear coordinate expressions, relegating deeper mathematical insights to the appendices on theorems of advanced calculus, constrained optimization, and vector equations of classical mechanics.

VECTOR ANALYSIS - MATH311 - Galicki

Introduction to Vector Analysis. The text is both a learning manual as well as a reference manual. It is based on a dual geometric-analytic approach to each topic of discussion. The concepts and theorems are first visualized and understood heuristically, and then are reduced to an algebra-calculus framework for computation or mathematical scrutiny.
