Ventilation: the transfer of CO₂ from the blood to the alveoli and out of the body . An important concept to remember: normal breathing is a negative-pressure phenomenon; mechanical ventilation is POSITIVE pressure ventilation. The end result is still airflow and gas exchange, but the mechanics are different.

Mechanical Ventilation Study Sheet - Straight A Nursing

Airways and Mechanical Ventilation There are two types of airways that are primarily used...the endotracheal and the tracheostomy. The goal with each of these is to maintain a patent airway and thereby effectively oxygenate the patient. For patients who cannot ventilate adequately, they will have mechanical ventilation. This is a supportive

Airways and Mechanical Ventilation What is respiratory ...

Patients undergoing mechanical ventilation for ARDS typically require higher levels of sedation and analgesia. The use of propofol for longer than 24 to 48 h requires periodic monitoring of serum triglyceride levels. There is evidence that continuously administered IV sedation prolongs the duration of mechanical ventilation.
